

Procedure

1. Install and launch Burp Suite Community Edition and create a temporary project for the web traffic analysis.
2. Open Burp Suite's Proxy settings and verify that the proxy listener is running on the local interface, normally 127.0.0.1, with the configured proxy port.
3. Configure the web browser to use the same HTTP/HTTPS proxy address and port as Burp Suite. For HTTPS testing, install Burp Suite's CA certificate in the test browser if required.
4. Open the authorized test web application in the configured browser and generate normal traffic by visiting pages, submitting forms, logging in, and performing other permitted actions.
5. Go to Proxy → HTTP history and review the captured HTTP requests and responses. Identify request methods, URLs, parameters, headers, cookies, and response status codes.
6. Select an interesting request from HTTP history and send it to Repeater.
7. In Repeater, modify one parameter or header at a time and resend the request. Observe changes in the application's response to analyze its behavior.
8. Use the Target → Site map section to examine the endpoints and resources discovered while browsing the application.
9. Use the Proxy → Intercept feature to capture requests before they are forwarded to the server. Modify permitted test requests and use Forward to send them to the application.
10. Analyze the captured traffic for security-related issues such as sensitive information in requests or responses, insecure cookie attributes, missing security headers, improper input handling, and unexpected application behavior.
11. Record relevant requests and responses as evidence. Document the affected endpoint, parameter, observed behavior, possible vulnerability, and recommended remediation.
12. After completing the analysis, turn off interception and restore the browser's original proxy settings.
